Mixing Ratio	80 parts	20 parts
Color	Green	White

### Mixed Properties

Solids	81%
Viscosity	185 – 225 ps

---

### MIXING

**PSR-4000 CC01SE DI** is supplied in pre-measured containers with a mix ratio by weight of 80 parts, **PSR-4000 CC01SE TR50917** and 20 parts, **CA-40 CC01SE TR60817**. For Screen Printing, mix both components together for 10 – 15 minutes.

For Curtain Coat and Spray, PMA solvent is added at 20-25%, of the mixed ink and hardener. **PSR-4000 CC01SE DI** can be mixed a mechanical mixer at low speeds to minimize shear thinning for 10 – 15 minutes. The resulting viscosity with the PMA addition should be between 60 – 100 seconds in a Ford #4 or Erichsen #4 cup at 24°C.

---

### PRE-CLEANING

Prior to solder mask application, the printed circuit board surface needs to be cleaned. Various cleaning methods include Pumice, Aluminum Oxide, Mechanical Brush, and Chemical Clean. For full body gold an alkaline cleaner is recommended. All of these methods will provide a clean surface for the application of **PSR-4000 CC01SE DI**. Hold time after cleaning the pcb should be held to a minimum to reduce the oxidation of the copper surfaces.

---

### SCREEN PRINTING

Method: Single Sided and Double Sided Screening

- Screen Mesh: 29 – 43 threads/cm (74 – 110 tpi)
- Screen Mesh Angle: 22.5° Bias
- Screen Tension: 20 - 28 Newtons
- Squeegee: 60 – 80 durometer
- Squeegee Angle: 27 – 35°
- Printing Mode: Flood / Print / Print
- Flood Pressure: 20 – 30 psi
- Printing Speed: 2.0 – 9.9 inches/sec
- Printing Pressure: 70 – 100 psi

## PROCESSING PARAMETERS FOR PSR-4000 CC01SE DI

---

**SPRAY APPLICATION** Start by setting the atomization pressure at 30 psi and spray a panel. Increase the spray atomization pressure until you have a smooth non-mottled surface. If you exceed 35 psi add additional solvent and reset the atomization pressure back to 30 psi and repeat process until you get a smooth sprayed surface. Adjust the Pot Pressure to get the desired solder mask thickness that meets your coverage requirements.

Method: HVLP sprayer

- Needle Set: 5 – 6 turns out
- Gun temperature: 90 - 100°C
- Atomization air temperature: 90 - 100°C
- Pot Pressure: 10-15 psi, adjust to get desired solder mask coverage
- Atomization Pressure: 30-35 psi, start at the low setting and increase until there is no mottling
- Conveyor speed: 2.5 – 3.0 ft./min; as slow as production allows

**CURTAIN COATING** Method: Single Sided Coating

- Temperature: 24°C
- Slot Width: 0.4 – 0.5 mm
- Belt Speed: 70 – 100 m/min
- Wet Weight: 85 – 140 grams/m<sup>2</sup>

---

### TACK DRY CYCLE

The Tack Dry step is required to remove solvent from the solder mask film and produce a firm dry surface. The optimum dwell time and oven temperature will depend on oven type, oven loading, air circulation, exhaust rate, and ramp times. Excessive tack dry times and temperature will result in difficulty developing solder mask from through holes and a reduction in photo speed. Insufficient tack dry will result in artwork marking and/or sticking. Typical tack dry conditions for **PSR-4000 CC01SE DI** are as follows:

- Oven Type: Conventional Batch or Conveyor
- Oven Temperature: 66 - 80°C (150 - 176°F)
- For Single-Sided (Batch Oven)
  - 1<sup>st</sup> Side: Dwell Time: 15 - 20 minutes
  - 2<sup>nd</sup> Side: Dwell Time: 15 - 40 minutes
- For Double-Sided (Batch or Conveyor)
- Dwell Time: 30 - 60 minutes
  
- Oven Type: IR or IR assisted
  - Conveyor Speed: 2.7 – 3.2 ft./min
  - Time above 80°C: 2 – 2.1 minutes
  - Maximum Peak Temperature: 115°C
  - Total Dwell Time: 3 – 6 minutes

**EXPOSURE**      **PSR-4000 CC01SE DI** was designed for the latest DI equipment. It requires UV exposure to define solder mask dams and features. The spectral sensitivity of **PSR-4000 CC01SE DI** is in the area of 365 nm. Exposure times will vary by bulb type, age of the bulb and light source type. Below are guidelines for exposing **PSR-4000 CC01SE DI** using the latest DI equipment.

- Exposure Unit: 8 kW or higher
  - Stouffer Step 21: **Clear 8 minimum** (on metal / under phototool)
  - Energy: 90 – 150 mJ / cm<sup>2</sup> minimum (under phototool)
- 

**DEVELOPMENT**      **PSR-4000 CC01SE DI** is developed in an aqueous sodium or potassium carbonate solution. Developing can be done in either a horizontal or vertical machine.

- Solution: 1% by wt. Sodium Carbonate or 1.2% Potassium Carbonate
  - pH: 10.6 or greater
  - Temperature: 85 - 95°F (29 - 35°C)
  - Spray Pressure: 25 - 45 psi (1.7 – 3.1 bars)
  - Dwell Time in developing chamber: 45 - 120 seconds
  - Water rinse is needed to remove developer solution followed by a drying step
- 

**FINAL CURE**      **PSR-4000 CC01SE DI** requires a thermal cure to insure optimal final property performance. Thermal curing can be done in a batch oven or conveyORIZED oven.

- Temperature: 275 – 300°F (135 – 149°C)
  - Time at Temperature: 45 – 60 minutes
- 

**UV CURE**      To improve moisture and chemical resistance a UV cure of 2 – 3 J/cm<sup>2</sup> is recommended.
