MIXING

For Screen Printing: **PSR-4000 CR01MW** is supplied in pre-measured containers with a mix ratio by weight of 87 parts, 3.48 kgs **PSR-4000 CR01MW** and 13 parts, 0.52 kgs, **CA-40 CR01MW**. **PSR-4000 CR01MW** can be mixed by a mechanical mixer at low speeds to minimize shear thinning for 10 – 15 minutes.

For Spray Application: after mixing the two parts, add 20% PM or PMA solvent to dilute the **PSR-4000 CR01MW** solder mask to a viscosity that can be sprayed. After adding the diluting solvent, thoroughly mix it to a consistent viscosity. A Din 4 cup reading of 75 – 85 seconds is recommended.

The mixed pot life is 48 hours at room temperature.

PRE-CLEANING

Prior to solder mask application, the printed circuit board surface needs to be cleaned. Various cleaning methods include Pumice, Aluminum Oxide, Mechanical Brush, and Chemical Clean. For full body gold an alkaline cleaner is recommended. All of these methods will provide a clean surface for the application of **PSR-4000 CR01MW**. Hold time after cleaning the printed circuit board should be held to a minimum to reduce the oxidation of the copper surfaces.

SCREEN PRINTING

Method: Single Sided and Double Sided Screening

- Screen Mesh: 29 – 43 threads/cm (74 – 110 tpi)
- Screen Mesh Angle: 22.5° Bias

- Squeegee: 60 – 80 durometer
- Squeegee Angle: 27 – 35°
- Printing Mode: Flood / Print / Print
- Flood Pressure: 20 – 30 psi
- Printing Speed: 2.0 – 9.9 inches/sec
- Printing Pressure: 70 – 100 psi

TACK DRY CYCLE The Tack Dry step is required to remove solvent from the solder mask film and produce a firm dry surface. The optimum dwell time and oven temperature will depend on oven type, oven loading, air circulation, exhaust rate, and ramp times. Excessive tack dry times and temperature will result in difficulty developing solder mask from through holes and a reduction in photo speed. Insufficient tack dry will result in artwork marking and/or sticking. Typical tack dry condition for **PSR-4000 CR01MW** is as follows:

- Oven Type: Conventional Batch or Conveyor
- Oven Temperature: 68 - 82°C (155 - 180°F)
- For Single-Sided (Batch Oven)
 - 1st Side: Dwell Time: 15 - 20 minutes
 - 2nd Side: Dwell Time: 35 - 40 minutes
- For Double-Sided (Batch or Conveyor)
- Dwell Time: 30 - 60 minutes
- Oven Type: IR or IR assisted
 - Conveyor Speed: 2.7 – 3.2 ft/min
 - Time above 80°C: 2 – 2.1 minutes
 - Maximum Peak Temperature: 115°C
 - Total Dwell Time: 3 – 6 minutes

EXPOSURE **PSR-4000 CR01MW** requires UV exposure to define solder mask dams and features. The spectral sensitivity of **PSR-4000 CR01MW** is in the area of 365 nm. Exposure times will vary by bulb type and age of the bulb. Below are guidelines for exposing **PSR-4000 CR01MW**. Retention of smallest feature will determine the exposing energy.

- Exposure Unit: 7 kW or higher
- Stouffer Step 21: **Clear 10 minimum** (on metal / under phototool)
- Energy: 600-800mJ / cm² minimum (under phototool)

DEVELOPMENT **PSR-4000 CR01MW** is developed in an aqueous sodium or potassium carbonate solution. Developing can be done in either a horizontal or vertical machine.

- Solution: 1% by wt. Sodium Carbonate or 1.2% Potassium Carbonate
- pH: 10.6 or greater
- Temperature: 85 - 95°F (29 - 35°C)
- Spray Pressure: 25 - 45 psi (1.7 – 3.1 bars)
- Dwell Time in developing chamber: 60 seconds
- Water rinse is needed to remove developer solution followed by a drying step

PROCESSING PARAMETERS FOR PSR-4000 CR01MW

PRE-CURE (OPTIONAL)

This step may be required if the vias remain tented on both sides after developing due to the board design. The added drying cycle will prevent out-gassing of the vias. This phenomenon can cause the solder mask over the vias to peel or pop and may also exhibit a degree of oozing due to the entrapped solvent. The required drying cycle is 100 - 110°C for 40 to 60 minutes. An extended time may be required on the higher aspect ratio.

FINAL CURE

PSR-4000 CR01MW requires a thermal cure to insure optimal final property performance. Thermal curing can be done in a batch oven or conveyORIZED oven.

- Temperature: 275 – 300°F (135 – 149°C)
 - Time at Temperature: 45 – 60 minutes
-

UV CURE

To improve moisture and chemical resistance a UV cure of 2 J/cm² is recommended. This will provide better surface cure and not yellow the white solder mask.
